

Create dictionary to  
store questions to

Open file in read  
mode

Read file by  
lines

Split the line by any  
defined separator

Add the data  
to the defined  
dictionary

**File read function**

Question to file export

Check if user entered a  
non existing question

If true open file in  
append mode

write the new data  
with a separator to  
the file and then add  
a new line

You'll have to use while  
loop with if statement

The actual bot works by saying something in the beginning like hi and then it loops for an input and checks if the question exists in the dictionary and if it doesn't exist it asks for what it should say next time it gets asked that but if the question exists in the dictionary then it prints the answer
